

PocketBudget AI

Personal Budget Management System

A Django web application for tracking expenses, budgets, saving goals, charts and local tips from Max.

Maksim Kernazhytski

Framework

Django

Database

SQLite

The problem and my solution

The app focuses on a simple money problem that many students know.

Problem

- Small expenses are easy to forget.
- At the end of the month it is hard to see where money went.

Solution

- The user adds expenses and budgets.
- Dashboard, charts and Max tips make the data easier to read.

Goal

- Keep the interface clear.
- Make budget tracking useful without a long manual.

What the user can actually do

The project covers the full basic flow of a personal finance app.

Auth

Register, login and logout

Expenses

Add, edit, delete and filter

Categories

Default and custom categories

Budgets

Overall and category monthly limits

Goals

Saving goals with progress

Charts

SVG charts and CSV export

The app is not only one CRUD page. It has user data, budget logic, analytics, exports and admin tools.

Local tips based on saved data

Max is the AI-style part of the project, but it works locally.

Input

- Expenses and dates
- Monthly and category budgets
- Saving goals and progress

Output

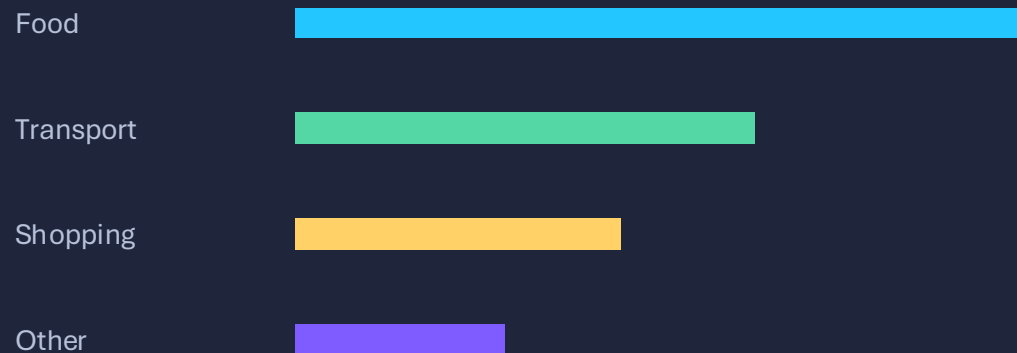

- Short spending tips
- Warnings when a budget is close or passed
- Goal comments and chart explanations

No paid API is needed. The rules are written in Python, so they are easy to test and explain.

From data to visual reports

This page helps the user understand spending faster.

Spending by category

Export options

Download SVG

Download CSV

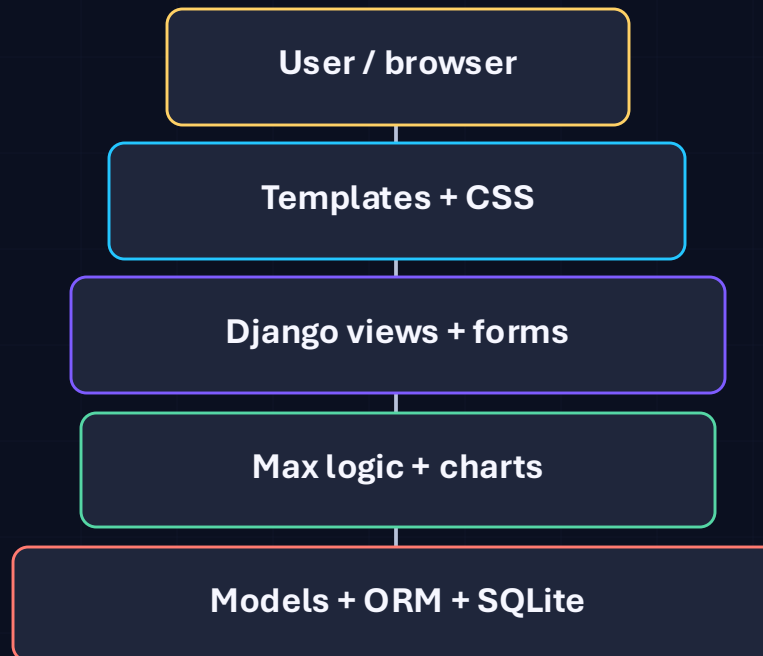

- Charts are generated from real user data.
- CSV export gives the user raw chart data.

Simple layered Django structure

I kept the structure clear instead of adding unnecessary complexity.

Main database models

- Category
- Expense
- MonthlyBudget
- SavingGoal
- AllInsight

Why it works

- Each user has private records.
- Django ORM handles database access.
- Business rules are not hidden in templates.

The GitHub version was checked

I tested the project after cloning it from GitHub.

Commands used

```
python manage.py check  
python manage.py test
```

Result

Django check

0 issues

Tests

27 passed

This shows that the repository version is working, not only my local copy.

What I would show live

The final project is ready as a working Django application.

1 Register / login

2 Add category

3 Add expense

4 Set budget

5 Create goal

6 Open Max Tips

7 Open Charts

8 Show Admin Stats

Final result: a useful personal budget app with CRUD, charts, export, local assistant Max, admin tools and tests.

Thank you
